The Burden of Occupational Cancer in Canada

Paul A. Demers, PhD

Director, OCRC, Cancer Care Ontario
Professor, University of Toronto

**CBOM Pre-Conference, Toronto,
September, 2019**

Conflict of Interests

- I have no conflicts of interest
- The Burden of Occupational Cancer Study was funded by the Canadian Cancer Society
- OCRC is funded by the Ontario Ministry of Labour, Cancer Care Ontario, and the Canadian Cancer Society
- CAREX Canada is funded by the Canadian Partnership Against Cancer

Assessing the Burden of Occupational Cancer in Canada

“burden” is the human impact & the economic costs associated with a specific cause of cancer

This project is funded by
Canadian Cancer Society
Research Institute Multi-Sector
Team Grant #701285

Canadian
Cancer
Society

Société
canadienne
du cancer

LUNG

Asbestos, crystalline silica, diesel engine exhaust, radon, arsenic, chromium, nickel, environmental tobacco smoke

LIVER AND BILIARY TRACT

Trichloroethylene, vinyl chloride

BLADDER

Aromatic amines

SKIN

Solar radiation, mineral oils, polycyclic aromatic hydrocarbons

NASOPHARYNX

Formaldehyde

LARYNX

Acid mists, asbestos

MESOTHELIOMA

Asbestos

BREAST

Shiftwork

OVARY

Asbestos

LEUKEMIA

Benzene, formaldehyde

NON-HODGKIN LYMPHOMA

Trichloroethylene

The burden project is a national collaborative effort with:

Joanne Kim, Manisha Pahwa,
Daniel Song, Kate Jardine,
Victoria Arrandale, Catherine
Slavik, Desre Kramer

Emile Tompa
Christina Kalcevich
Young Jung, Amir Mofidi

Cheryl Peters, Calvin Ge,
Elizabeth Rydz,
Anne-Marie Nicol

France Labrèche
Martin Lebeau

Hugh Davies
Chris McLeod

Jérôme Lavoué

Lesley Rushton
Sally Hutchings

The *IARC Monographs* identify environmental factors that can increase the risk of human cancer. These include chemicals, complex mixtures, occupational exposures, physical agents, biological agents, and lifestyle factors. National health agencies can use this information as scientific support for their actions to prevent exposure to potential carcinogens.

Interdisciplinary working groups of expert scientists review the published studies and evaluate the weight of the evidence that an agent can increase the risk of cancer. The principles, procedures, and scientific criteria that guide the evaluations are described in the *Preamble* to the *IARC Monographs*.

Since 1971, more than 1000 agents have been evaluated, of which more than 400 have been identified as carcinogenic, probably carcinogenic, or possibly carcinogenic to humans.

Attributable Risk (AR)

- Burden of disease projects rely on the calculation of AR's (sometimes called etiologic fraction, attributable risk proportion)

- $$AR = \frac{Pr(E)(RR-1)}{Pr(E)(RR-1)+1}$$

Levin's equation (1953), where Pr(E) is proportion exposed in the target population and RR is the Relative Risk associated with exposure

Challenge: Estimating History of Exposure among the General Population

A National Occupational & Environmental Exposure Surveillance Project

Based at:

1. Faculty of Health Sciences,
Simon Fraser University, Vancouver
2. School of Population and Public Health,
University of British Columbia , Vancouver
3. Alberta Health Services
4. Occupational Cancer Research Centre, Toronto

CAREX Canada: Job-Exposure Matrix

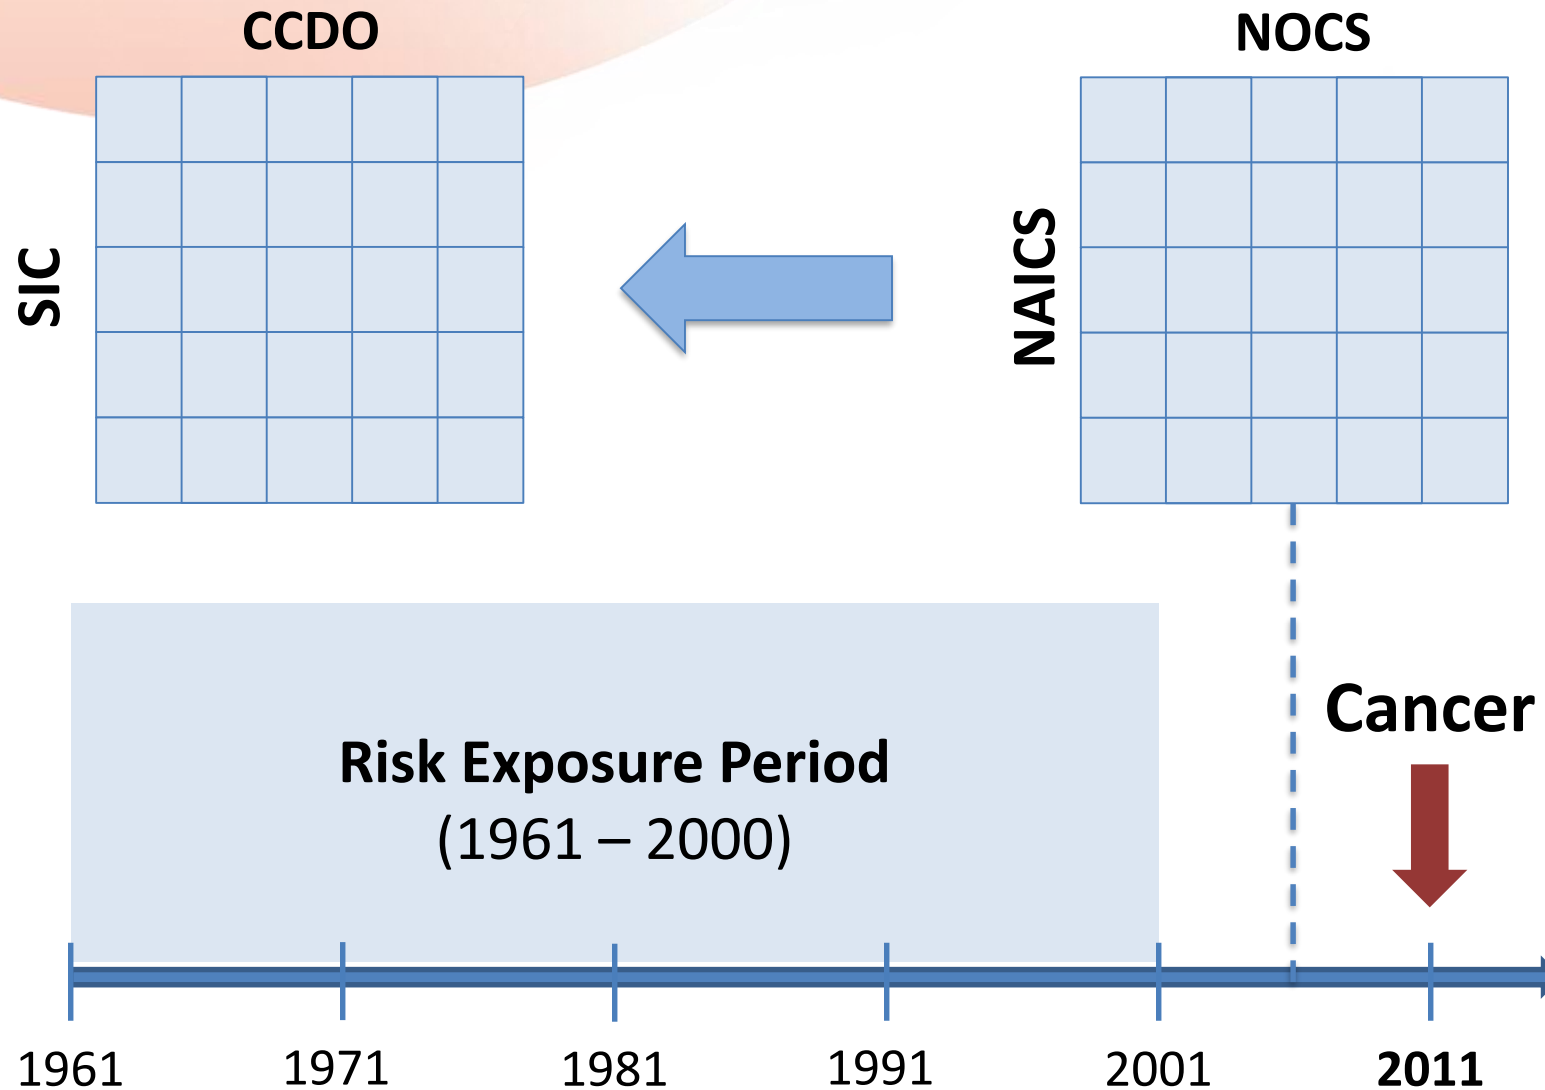

- CAREX Canada: Prevalence and level of exposure
 - 328 industries & 520 occupations

National Occupational Classification System 2006 (NOCS)

	Prevalence / Level	Occ 1	Occ 2	...	Occ 519	Occ 520
North American Industrial Classification System 2002 (NAICS)	Ind 1	0.2/L	1.0/L	...		
	Ind 2			...	0.5/H	0.1/M

	Ind 327	0.6/M		...	1.0/L	1.0/L
	Ind 328	0.5/H	1.0/L	...	0.8/L	

Applying CAREX JEMs to estimate burden

Apply the CAREX JEM to Census Data

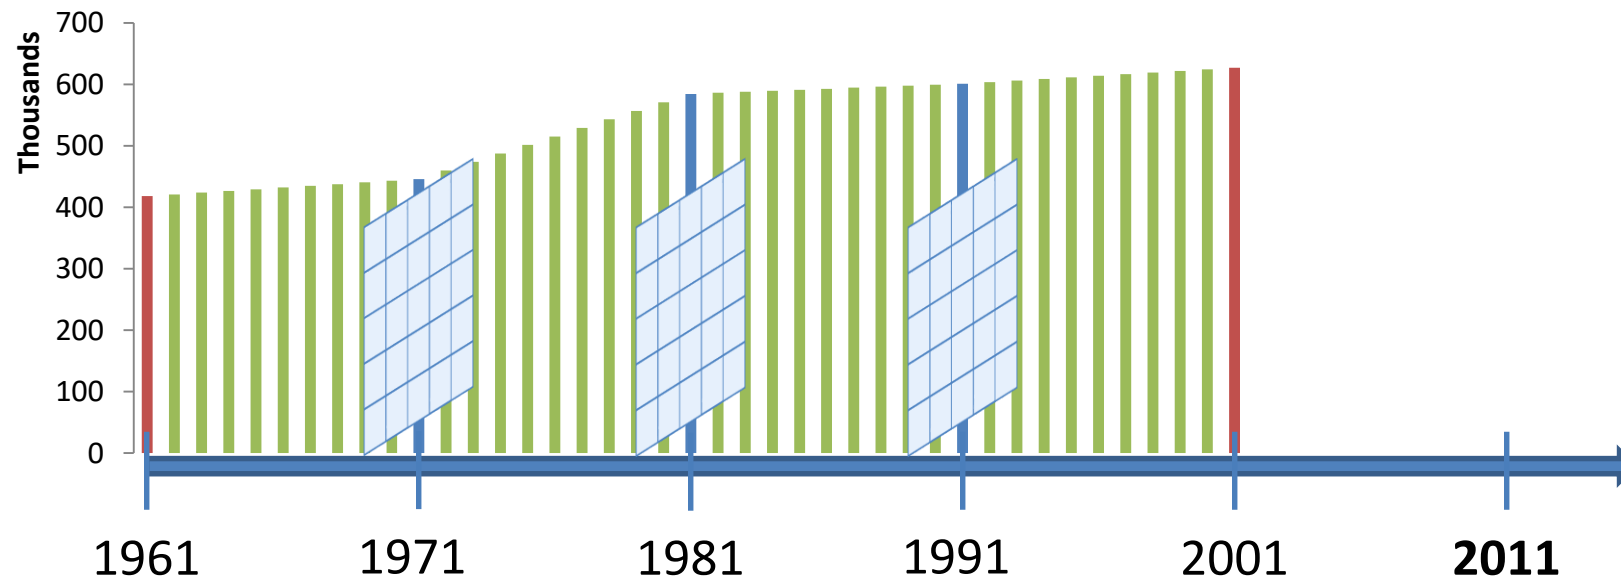

Apply the CAREX JEM to Census Data

- Census employment data (1971/1981/1991)
- Use 1961 and 2001 census data to anchor time trends
- Add estimates for intermediate years

⇒ Number of exposed workers in each REP year

Exposed: Detailed Picture over Time

- CAREX JEM + Census data
 - *Industry, occupation, province, sex, exposure level*
- Labour Force Survey for age distribution
- National Enhanced Cancer Surveillance System for tenure distribution

Population Modelling

- How to estimate the number of workers ever exposed ($N_{e(REP)}$)?
 - Count everyone in the initial REP year
 - Add “new hires” from each subsequent year

Population Modelling

- Accumulate exposed workers over the REP
- Account for survival

*For illustration purposes only, not real results

Diesel exhaust exposure

Transportation and warehousing
400,000 (49%) exposed

Construction
94,000 (9%) exposed

Mining & oil and gas
61,000 (26%) exposed

Agriculture, forestry, and fishing
54,000 (10%) exposed

Public admin
51,000 (5%) exposed

16

Diesel Exhaust Exposure Distribution

CAREX Level (based on average exposure)	Population in 2011, ever exposed during Relevant Exposure Period	Cumulative Exposure ($\mu\text{g}/\text{m}^3$ - years EC)		
		Mean	Min	Max
Low	1,357,000 (84%)	41	5	99
Moderate	199,000 (12%)	131	17	299
High	56,000 (3%)	1,575	225	2,957

Example: Diesel & Lung Cancer (national)

*Proportion in
2011 exposed
(1961 – 2001)*

6.8% of the 2011 population, or
1,612,000 current or former workers

*Relative Risk
and Source*

A dose-response curve from a meta-
analysis of cohort studies *

*Attributable
Cancers*

560
lung cancers
AF = 2.4%

* Vermeulen R, Silverman DT, Garshick E, Vlaanderen J, Portengen L, Steenland K. 2014. Exposure-response estimates for diesel engine exhaust and lung cancer mortality based on data from three occupational cohorts. *Env Health Persp* 122:172-77.

Contents of the National Report

For the most common, well-established (IARC 1 & 2A) carcinogens in Canada:

- Number of new cancers diagnosed annually based on the Burden of Occupational Cancer Project
- Number of workers currently exposed and where
- Policy and workplace prevention recommendations
 - We convened a national policy advisory committee

Top 10 Occupational Carcinogens in Canada

Carcinogen	Annual Cancers	Exposure*
Solar UV at Work	4600 non-melanoma skin	1.5 million
Asbestos	1900 lung, 430 mesothelioma, 45 larynx, 15 ovarian, ** digestive	152,000
Diesel Exhaust	560 lung, ** 200 bladder	897,000
Crystalline Silica	570 lung	382,000
Welding Fumes	310 lung	333,000
Nickel	170 lung	117,000
Chromium VI	50 lung	104,000
Radon	190 lung	188,000
PAH's	** 130 lung, 50 skin, 80 bladder	350,000
Shiftwork	** 470-1200 breast	1.9 million

* Based on CAREX Canada

** Suspected cancer (IARC 2A)

Asbestos

- Approximately 152,000 still regularly exposed
- ~1,900 lung cancers, 430 mesotheliomas, 45 laryngeal cancers & 15 ovarian cancers
- Canadian government committed to ban in 2018. However, much more needed
- ***Policy recommendations:***
 - *Create a public registry of all public buildings & workplaces that contain asbestos*
 - *Establish an inter-ministerial working group to address occupational asbestos exposure & issues such as safe disposal, building renovation/abatement, public health...*

	Lung Cancer	Mesothelioma
Average cost per case	\$980K	\$1.1 M
Total Cost	\$1.9 billion	\$480 million

-  Healthcare & administrative
-  Caregiving & out-of-pocket
-  Output & productivity
-  Health-related quality of life

Tompa et al. The economic burden of lung cancer and mesothelioma due to occupational and para-occupational asbestos exposure. *Occup Environ Med* 2017;74:816-22.

Solar Ultraviolet (UV) Radiation

- ~ 4,600 non-melanoma skin cancers annually
- Greatest burden in construction & agricultural. Other groups, such as outdoor utilities, parks & recreation workers
- 1,476,000 Canadian workers exposed

Policy recommendation:

- *Require all workplaces with workers that work outdoors for part or all of the day to develop a comprehensive, multi-component sun safety program*
 - *includes a risk assessment, sun protection control measures, and sun protection policies and training (Sun Safety at Work Canada provides examples)*

Diesel Engine Exhaust

- ~ 560 lung and possibly, 200 bladder cancers annually
- Greatest burden in transportation, construction & mining
- 897,000 workers exposed

Policy recommendations:

- *Adopt occupational exposure limits of 20 $\mu\text{g}/\text{m}^3$ elemental carbon for the mining industry and 5 $\mu\text{g}/\text{m}^3$ elemental carbon for other workplaces*
- *Upgrade or replace old on-road and off-road trucks and diesel engines*
 - There is a precedent for mandating the transition for on-road vehicles in jurisdictions such as California

Crystalline Silica

- ~ 570 lung cancers annually
- Greatest burden in construction, mining, and mineral products processing
- 382,000 workers exposed

Policy recommendations:

- Occupational exposure limits for silica vary across Canada from 0.025 mg/m³ to 0.1 mg/m³ in some jurisdictions. *Implement 0.025 for all workplaces in Canada.*
- Collection of exposure data and ongoing monitoring should be implemented as part of a broader silica control plan to assist in preventing exposure.

Welding Fumes

Classified as Group 1 in 2017

- ~ 310 lung cancers annually
- Greatest burden in manufacturing & construction
- ~375,000 workers exposed

Policy recommendations:

- *Introduce ventilation requirements in Occupational Health and Safety (OHS) legislation for welding activities*
- As a Group 1 carcinogen, a specific OEL for respirable welding fumes is needed

Radon

- Approximately 190 lung cancers annually
- Approximately 188,000 workers exposed in underground work or poorly ventilated workplaces in high background regions

Policy recommendations:

- *Develop explicit and specific regulation of radon in indoor air in occupational health and safety regulations consistent with the Naturally Occurring Radioactive Materials (NORM) Guidelines*
- *Implement 200 Bq/m³ as the exposure standard for remediation in all underground and above-ground workplaces*

Polycyclic Aromatic Hydrocarbons (PAHs)

- Estimated 350,000 workers exposed
- Largest proportion of workers exposed in accommodation and food services
 - Cooks, chefs, food and beverage servers
- ~130 lung, 80 bladder, 50 skin cancers annually

Policy recommendation:

- *Implement effective engineering controls in workplaces where exposure occurs, especially at high levels.*

Shift Work at Night

- Up to 1200 breast cancer suspected annually
- 1.9 million working Canadians, depending on definition
 - Healthcare, hospitality industry, manufacturing, public safety

Prevention is challenging

- *Optimizing work schedules to minimize circadian disruption*

BURDEN OF OCCUPATIONAL CANCER IN CANADA

Major Workplace Carcinogens
and Prevention of Exposure

SEPTEMBER 2019

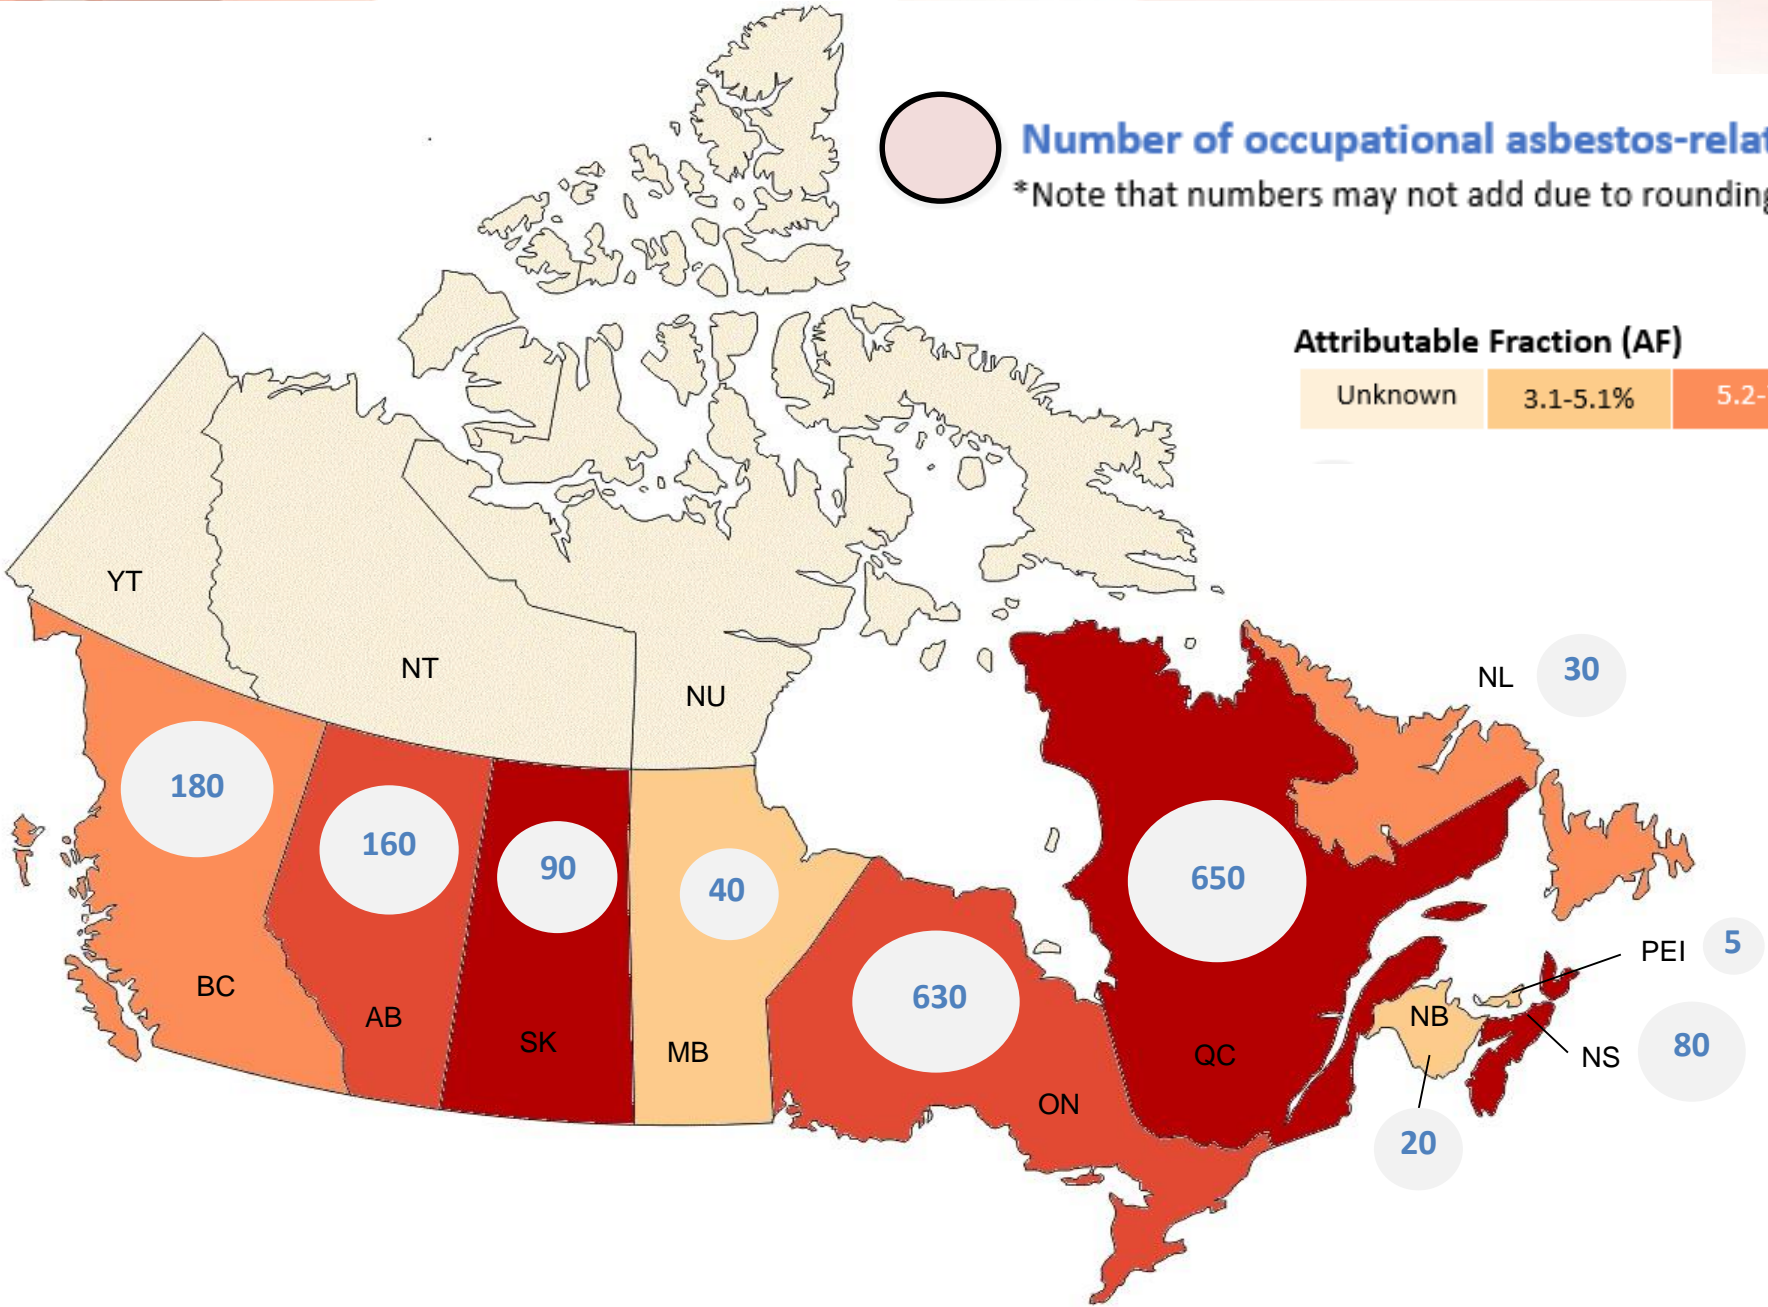

Number of occupational asbestos-related lung cancers annually*

*Note that numbers may not add due to rounding

Attributable Fraction (AF)

Unknown	3.1-5.1%	5.2-7.7%	7.8-8.9%	9.0-11.5%
---------	----------	----------	----------	-----------

Other Carcinogens & Emerging Issues

- They were also other carcinogens with smaller numbers of cancers or less-established cancer associations
- The report focused on well-established carcinogens, but included emerging issues, including pesticides, anti-neoplastic agents, nanomaterials, sedentary work
